SAKHDAROV, V. C.

Saharov, I. E. The bending of a wedge-shaped clamped plate under the action of an arbitrary load. Akad. Nauk SSSR. Prikl. Mat. Meh. 12, 407-414 (1948). (Russian)

The paper deals with small deflections w of an infinite wedge-shaped elastic plate subjected to an arbitrary normal load $p(\rho, \theta)$, where ρ and θ are polar coordinates in the plane of the plate. If the angle of the wedge is 2α , the clamping condition requires that on the sides $\theta = \pm\alpha$ of the wedge $w = \rho^{-1} \partial w / \partial \theta = 0$. The solution is sought in the form $w = (p/8\pi D)(r^2 \Gamma + \psi)$, where ψ is a regular biharmonic function, $\Gamma(\rho, \theta; \rho_0, \theta_0)$ is a harmonic Green's function for the wedge, $r^2 = \rho^2 + \rho_0^2 - 2\rho\rho_0 \cos(\theta - \theta_0)$, p is a concentrated load applied at (ρ_0, θ_0) and D is flexural rigidity. The solution is obtained, for the deflection w under a concentrated load p , in the form of an integral with ρ_0 and θ_0 as parameters. The problem for a distributed load is solved by integrating over the loaded region. The paper contains calculations for the deflection, and bending and twisting moments along the sides of the plate, under a concentrated load when $\alpha = \pi/4$.

Saharov, I. E. Bending of a rod under centrifugal force.
Akad. Nauk SSSR. Prikl. Mat. Mekh. 13, 329-330 (1949).
(Russian)

Consider a homogeneous horizontal rod of constant cross section, rotating with constant angular velocity about a vertical axis to which one of the ends of the rod is clamped. If r is measured perpendicular to the axis, and $w(r)$ is the (small) deflection, then $Bw'' - [T(r)w'] = f(r)$, where B is the constant flexural rigidity, $T(r)$ is the tension, and $f(r)$ is the transverse load, including the weight of the rod. The end conditions are $w(0) = w'(0) = w''(L) = w'''(L) = 0$, where L is the length of the rod. Using $w''(L) = 0$, a second order nonhomogeneous ordinary differential equation is obtained for w' , which is solved explicitly in terms of confluent hypergeometric functions (reference is made to C. Wells and R. Spence [J. Math. Physics 24, 51-64 (1945); these Rev. 7, 66]). The deflection $w(r)$ is then obtained by integration, and all three remaining arbitrary constants are determined to fulfill the other three end conditions. J. B. Das.

ABSTRACT: It is frequently necessary to calculate the behaviour
of ring-shaped plates under dynamic load conditions and
particularly to determine the frequency of their natural
oscillations. In this paper formulae are derived for
calculating the frequency of the natural oscillations and
the derived formulae are utilised for plotting graphs of the
dependence of the basic wave and of the first two harmonics
of natural oscillations as a function of the relative hole
area for two types of boundary conditions, namely, for the
case that the external edge is rigidly clamped and for the
case that the external edge is freely supported.

TITLE: On forced oscillations of stators of a.c. electrical machines. (O vynuzhdennykh kolebaniyakh statorov elektricheskikh mashin peremennogo toka).

PERIODICAL: Izvestiya Akademii Nauk SSSR, Otdeleniye Tekhnicheskikh Nauk, 1957, No.11, pp. 167-169 (USSR)

ABSTRACT: In a.c. machines forces of magnetic attraction between the rotor and the stator are generated which rotate together with the field. Since the stator of the machine represents an oscillation system, the rotating magnetic forces of attraction generate vibrations in the stator which, in certain cases, have to be eliminated or at least reduced. This phenomenon can be described using the following simplifying assumptions: the stator is considered as a thin ring of unit width; in the expression for the induction in the air gap only the fundamental is taken into consideration; as resistance forces the forces of external friction are considered which are proportional to the speed of displacement of the axis of the ring and also the internal friction which is proportional to the speed of deformation of the ring fibres. The motion of an element of the uniform thin ring of equal cross section,

Card 1/3

24-11-20/31

On forced oscillations of stators of a.c. electrical machines.

to which the back of the stator is reduced, is expressed by equations given by Love, A. (Ref.1). The internal friction is taken into consideration by means of the formula given by Kushul', M. Ya. (Ref.2) expressing the dependence between the stresses, deformations and the deformation speed, Eq.(3), p.167. The dynamic bending of the back of the stator can be considered as equalling the static bending under the effect of a load $(2pP/\pi R)x \cos^2 p\theta$, increased by a dynamic coefficient, k_2 and rotating with an angular speed ω . The maximum bending lags behind the maximum of the distributed load by an angle χ . The derived solution reflects qualitatively the observations made in experimental study of the vibrations of the stators of electrical machines, particularly stators of turbo-generators, namely, that in each point of the laminations the oscillation frequency $2 p\omega = 100$ c.p.s. and that the vibrations along the cross section of the machine at the points spaced at 45° apart are always shifted in phase by 90° . The calculated and the experimentally determined maximum bending values differ and this is attributed to the difference between the calculated and the real natural

TITLE: Determination of the dynamic stiffness of the rotor supports
of a turbo-generator. (Opredeleniye dinamicheskoy zhestkosti
opor rotora turbogeneratora.)

PERIODICAL: "Vestnik Elektropromyshlennosti" (Journal of the Electrical
Industry), 1957, Vol. 28, No. 5, pp. 31 - 34, (U.S.S.R.)

ABSTRACT: The stiffness of rotor supports influences the critical
speed of an alternator, and if the support is considered as
an oscillating system it is necessary to know its dynamic
characteristics. These cannot be calculated and accordingly
experimental determination of the dynamic stiffness of the
supports is required. This article gives the results of such
a determination.

The oscillations of the bearings were set up by means of an
eccentric vibrator with an amplitude force value of 5 000 kg at
a speed of 3 000 r.p.m. The vibrator was driven by a 9 kW d.c.
motor. The vibrator was rigidly fixed to a special steel liner
which replaced the usual bearing liners at the exciter and the
turbine ends. Oscillations of the support in three directions
were measured by a vibrograph type UV-2.

To determine the dynamic stiffness of the support of a
turbo-generator from the exciter end in the vertical direction
the vibrator was installed so that the force acted vertically.

Determination of the dynamic stiffness of the rotor supports
of a turbo-generator. (Cont.)

Records were made of three components of the oscillation of
the bearing over the speed range from 0 to 3 400 r.p.m. Then
the vibrator was installed so that the force acted horizontally
and the recordings were repeated. Similar tests were carried
out from the turbine end. The speed of the vibrator was
increased by stages.

The test results are presented in the form of graphs.
The dynamic stiffness of the supports is obtained by dividing
the magnitude of the exciting forces by the corresponding
amplitudes of vertical or transverse oscillation. On the
basis of the experimental results formulae are given for the
rigidity of the turbo-generator supports as functions of the
speed. The dynamical stiffnesses obtained were used to
calculate the critical speed, and the calculated values are
compared with experimental ones. The procedure of calculations
for determination of the dynamic stiffness of a support from
the exciter end is given as an appendix and a particular
example is worked out. The results are in good agreement with
the experimental data.

TITLE: Calculation of the Critical Speeds of a Turbo-generator
Rotor on Elastic-massive Supports using an Electronic
Computer. (Raschet na elektronnoy schetnoy mashine kriti-
cheskikh skorostey rotora turbo-generatoria na uprugo-mass-
ivnykh oporakh)

PERIODICAL: Vestnik Elektropromyshlennosti, 1957, Vol.28, No.10,
pp. 9 - 17 (USSR)

ABSTRACT: Turbo-generators with an output of greater than about 6 MW
are made with flexible shafts and the working speed is above
a critical speed. In designing a rotor it is important to be
able to ensure that the working speed is at least 20-30% away
from the critical speed. This article deals with the influence
of give, or pliability of the support bearings of the turbo-
generator on the critical speeds of the rotor. The problem is
solved accurately by means of a computer. The critical speeds
are determined as roots of a characteristic equation obtained
from boundary conditions and conditions of continuity of geo-
metrical and power factors at places of step-wise change in
the section of the rotor on the assumption that the rotor con-
sists of a number of parts of constant section to each of which

110-10-3/18

Calculation of the Critical Speeds of a Turbo-generator Rotor on Elastic-massive Supports using an Electronic Computer.

the equations of oscillation of a beam are applicable. The results of the calculation graphically show the relationship between the critical speeds and the various amounts of give in the two bearings. The results may be compared with calculations of critical speed made by the usual graphical methods.

The formulation of the equation for determination of the critical speeds is then described. The turbo-generator rotor is considered as a beam consisting of a number of sections of different rigidity with a common axis with elastic massive end supports. The equations and boundary conditions are given. The equations required to determine the critical speeds in a rotor consisting of eleven different sections are given in Table 1.

The procedure of calculation for a rotor of eleven sections is then described. Allowance was made for the rigidity of the copper and wedges in the slot. Seven values of static elasticity were used for each support, taking the weight of the support as ten tons. Engineer L.P. Friedman participated in the derivation of the formulae. The equation for the critical speeds is given and appropriate characteristics for the rotor and the supports are taken from Tables 2 and 3. There is a total of card 2/4 28 variants which makes the problem very complicated but simpli-

110-10-3/18

Calculation of the Critical Speeds of a Turbo-generator Rotor on
Elastic-massive supports using an Electronic Computer.

fying assumptions are explained. The application of the equation to a large electronic computer with a memory system containing 1 024 cells is explained. The way in which the method was simplified to adapt it to the computer is explained. The final programme contained 251 orders whilst a further 81 cells were occupied by standard signs and constants used in the programme. Engineer B.I. Kuznetsov participated in the work. Four constants were located in an external memory device to which reference had to be made 28 times. Each variant was worked out in rather less than two minutes which corresponds to approximately a million operations per variant. It is not difficult to extend this programme to a rotor with a greater number of sections. Therefore, once the programme has been drawn up it can be used for practically any turbo-generator rotor. It is, of course, necessary each time to substitute fresh initial data.

The four first critical speeds of the rotor were determined for the variants given in Tables 2 and 3. The results are given in Figs. 2, 3, 4 and 5. The yield of one of the supports is plotted on the abscissus and the yield of the other is the parameter of a family of curves giving the values of the critical speed. Fig. 6 gives the first four critical speeds as a function

110-10-3/18

Calculation of the Critical Speeds of a Turbo-generator Rotor on
Elastic-massive supports using an Electronic Computer.

of the yield of the supports for the case when both supports have
the same dynamic characteristics. The graphs show that, within
the range investigated, variations in the yield of the supports
has little influence on the first critical speed but much more
influence on the higher critical speeds. A practical example is
given based on data obtained from a power station. It is shown
that the effect of yield in the supports is to reduce the first
critical speed by 6% and the second by 25%.

The calculations demonstrate the effectiveness of computers
in solving new problems of turbo-generator design connected with
reduction of vibration.

anizotropnykh uprugo-massovykh oporakh)

PERIODICAL: Izvestiya Akademii nauk SSSR, Otdeleniye tekhnicheskikh
nauk, Mekhanika i mashinostroyeniye, 1959, Nr 3,
pp 53-58 (USSR)

ABSTRACT: The various factors affecting the vibrations of turbines
can be investigated when their shaft disc can be adjusted
by means of the flexible bearings which incorporate a set
of springs. This type of bearing is known as
anisotropic. Such an arrangement is illustrated in
Fig 1, where displacements of the disc and bearings can
be measured. The following notations are used for the
calculations:

c_u , c_v - coefficients of shaft rigidity,

m - mass of the disc,

Card 1/4 c_x , c_y - coefficients of bearing rigidity in the vertical
and horizontal directions respectively,

SOV/179-59-3-8/45

Constrained Vibrations of the Disc on a Horizontal Unequal Shaft
Rotating in Anisotropic Flexible Bearings

M = mass of bearing,

ω = angular velocity of shaft rotation,

g = gravity,

e_u , e_v = coordinates of the disc centre,

x_1 , y_1 = projected coordinates of the disc centre,

x_2 , y_2 = projected coordinates of the bearing centre.

The differential equations of the motion of the disc and the bearing centres, projected at the axis x_2 , y_2 can be described as shown in Eq (1.1), and those of the disc projected at the axis x_1 , y_1 as Eqs (1.2). These become

Eq (1.4) when the forces of interaction between the bearing and the disc, Eq (1.3), are substituted. The complex formula of Eq (1.4) can be given as Eq (1.6).

Their solutions can be obtained as Eqs (1.8) and (1.9) when the expressions (1.7) are introduced. These equations can be determined with various approximations.

The zero approximation for the action of the disc's weight can be obtained as Eq (2.1), whilst in the case

Card 2/4

SOV/179-59-3-8/45

Constrained Vibrations of the Disc on a Horizontal Unequal Shaft
Rotating in Anisotropic Flexible Bearings

of the unequal shaft - as Eqs (2.2) and (2.3). The character of the critical velocity in the latter case is illustrated in Fig 2, where μ - parameter defining the ratio of the mass of half of the disc to that of the bearing. Similarly, the first approximation for the two groups are obtained as Eqs (3.1) to (3.3) and Eqs (3.4) to (3.7) respectively. The projected displacement of the centres of the disc and bearings at the axis x_j and y_j can be determined as Eqs (4.1) and (4.2) respectively. It can be seen from these formulae that the magnitude of the critical velocities (i.e. with the number of revolutions when the vibrations show their maximum) is not constant. This magnitude increases when the specific frequency of the bearing vibrations becomes near to the first critical velocity of the shaft with large parameters μ (Fig 2). Also, the number of critical velocities of the shaft increases. Generally, it can be said that the investigations showed the complex effect accompanying the rotation. These effects in the case of turbines

TITLE: Dynamic Rigidity in the Theory of Axially Symmetric Vibrations of Circular and Annular Plates 16

PERIODICAL: Izvestiya Akademii nauk SSSR, Otdeleniye tekhnicheskikh nauk, Mekhanika i mashinostroyeniye, 1959, Nr 5, pp 90-98 (USSR)

ABSTRACT: The paper is a continuation of previous work (Ref 5). The method of dynamic rigidity has been successfully applied by a number of workers to the investigation of torsional, bending and other vibrations of rods and rod systems. The value of the method is that it enables the dynamic properties of complex systems to be inferred from the properties of simpler systems. In particular, it is possible to determine the change of natural frequency of separate structural elements as a result of incorporation into the structure. Dynamic rigidities are quantities characterizing the relation between the sinusoidal generalized forces and the sinusoidal generalized displacements. The dynamic rigidity of a circular plate subjected to a concentrated force at the centre and either clamped or supported at the

Card 1/2

67595

SOV/179-59-5-16/41

Dynamic Rigidity in the Theory of Axially Symmetric Vibrations of Circular and Annular Plates

circumference is found in terms of Bessel functions. The problem is then considered of two annular plates, one having external radius a and internal radius b , the second having external radius b and internal radius c . The plates are mutually connected along the circumference of radius b by a hinged support. The thicknesses and properties of the plates may be different. The dynamic rigidities K_1 and K_2 of the two plates are found from the differential equation governing their vibrations and the frequency of the combined system is found from the condition $K_1 + K_2 = 0$. This equation is solved graphically for the cases when the external plate is clamped or supported at its external boundary. The method is also applied to the determination of the natural frequency of axially symmetric vibrations of a cylindrical shell closed at one end by an annular plate. Thanks are expressed to N.K. Pessenikova for help in carrying out the work. There are 3 figures and 7 Soviet references.

PERIODICAL: Izvestiya Akademii nauk SSSR, Otdeleniye tekhnicheskikh
nauk, Mekhanika i mashinostroyeniye, 1960, No. 5,
pp. 154-156

TEXT: A widely applied method in engineering calculations
involves the transition from shells with a number of strengthening
ribs to homogeneous orthotropic shells. The utilization of this
method for determining the natural vibration frequency of this
spherical and conical shells, strengthened by radial and
circumferential ribs, often allows satisfactory practical solutions
to be achieved which are unattainable by other methods. For an
orthotropic spherical shell of radius R , the principal
elasticity directions are taken as coinciding with the coordinates
 α , β . The elastic properties are characterized by the
extensional and flexural rigidities B_1 , D_1 in the direction α ;
and B_2 , D_2 , in the direction β ; the shear and torsional
rigidities B_{12} , D_{12} .

TITLE:

Work Function of Thin Barium Oxide Films on
Molybdenum BasePERIODICAL: Radiotekhnika i elektronika, 1960, Vol.5, No.9,
pp.1500-1507

TEXT: An oscillographic method for measuring work function from the shift of volt-ampere characteristics has been developed, substantially shortening the duration of the measurement and reducing the intensity of electron bombardment of the sample. A feedback circuit is used in which variation of the sample of potential is compensated to maintain the potential between the anode and the cathode constant. All possible causes for a change in the slope of the characteristics, for example, cathode heating currents, have been reduced to a minimum. Hence, the only cause for change in slope admitted by the authors is a change in contact difference of potentials. The change was read on a pointer instrument and also observed on the oscilloscope screen. Measurements were carried out in an experimental diode (Fig.3) at residual pressures of the order of 10^{-9} mm Hg. In each sealed-off

TITLE: The natural fundamental vibration frequencies of sloping orthotropic spherical shells

PERIODICAL: Izvestiya Akademii nauk SSSR, Otdeleniye tekhnicheskikh nauk, Mekhanika i mashinostroyeniye, 1961, No.2, pp.168-172

TEXT: The paper is a continuation of previous work (Ref.1: Izv. AN SSSR, OTN, Mekhanika i mashinostroyeniye, 1960, No.5; Ref.3: Izv. AN SSSR, OTN, 1957, No.5; Ref.4: Izv. AN SSSR, OTN, Mekhanika i mashinostroyeniye, 1959, No.6). The problem dealt with is the theoretical determination of the natural fundamental frequency of part of a spherical shell bounded by two parallel circles of the radii a and b ($a < b$), applying the equation of sloping orthotropic spherical shells derived in earlier work (Ref.1). It is assumed that one of the main directions of orthotropy coincides with the meridian of the shell (the coordinate α changes along the meridian). If the oscillations of the fundamental frequency are axis symmetrical, the equations can be

Card 1/2

24549

The natural fundamental vibration ... S/179/61/000/002/017/017
E073/E535 X

simplified. Utilizing the fact that the oscillations are harmonic, the sag can be determined as a function of the stresses. The basic differential equation governing the vibration is stated, together with the analytical expressions for the boundary conditions. The frequencies of vibration are found by the Bubnov-Galerkin method and are shown graphically as a function of a/b for clamped and supported external boundaries, and for various ratios of the elastic constants of the orthotropic material forming the shell. There are 6 figures and 4 references: all Soviet.

TITLE: Introducing an electron beam into plasma located in a strong magnetic field

SOURCE: Radiotekhnika i elektronika, v. 9, no. 5, 1964, 838-843

TOPIC TAGS: electron beam, plasma, plasma amplifier, plasma shf oscillator, plasma proof electron beam

ABSTRACT: A new electron-beam source is described in which the beam is shielded from plasma penetration into the accelerating gap and from ion bombardment of the cathode. A sharp nonuniformity of an external magnetic field created by counter-connected coils is used for shielding. The device used in the experiments (see Fig. 1 of the Enclosure) consisted of a 50-mm-diameter, 500 mm-long, glass cylinder filled with He at 10^{-2} to $(1-2) \times 10^{-7}$ torr. Both the accelerating gap and the discharge gap were in the uniform-magnetic-field region. The anode-discharge-cathode distance was 120 mm. An electron-beam collector with an analyzer permitted evaluating the straggling of electrons in the beam. Stable operation was observed

Card 1/3

L 23907-65

ACCESSION NR: AP4038643

served at pressures of up to 5×10^{-2} torr in He. The magnetic nonuniformity resulted in a reduction in the ion current (through the cathode) by 3 orders of magnitude. The energy straggling of electrons associated with longitudinal motion was 20% or less of the total energy involved. "The authors are deeply indebted to V.Ye. Golant for his constant help and discussing the results." Orig. art. has: 3 figures and 4 formulas.

TITLE: Electromagnetic radiation from an electron beam traversing a plasma in a magnetic field

SOURCE: Zhurnal tekhnicheskoy fiziki, v. 35, no. 11, 1965, 2034-2041

TOPIC TAGS: helium plasma, plasma beam interaction, plasma, plasma oscillation,
plasma wave, cyclotron resonance, electron beam

ABSTRACT: The authors have investigated the microwave (3 cm wavelength) fields in and radiation from plasmas produced by 20 to 900 mA beams of 0.8 to 2 keV electrons traversing helium at pressures from 5×10^{-3} to 1×10^{-1} mm Hg in the presence of a 2kOe or weaker uniform longitudinal magnetic field. The plasmas were produced in a 5 cm diameter 40 cm long glass tube containing at one end an electron gun producing a 0.5 cm diameter beam. The electron gun was operated with 2 μ sec pulses at a repetition rate of 50/sec. The radial distribution of the longitudinal microwave electric field was determined with the aid of a uhf probe consisting of a section of twinlead with 4 mm spacing, and the radiated microwaves were received with an open ended wave-

Card 1/2 UEC: 533.9

L 6313-66

ACC NR: AP5028318

guide section located close to the discharge tube. The uhf signals were recorded with a superheterodyne receiver with a 2 Mc passband and a sensitivity of $5 \times 10^{-12} W$. One conductor of the uhf probe was employed also as a Langmuir probe to determine the plasma density. The discharge tube contained in the end opposite the electron gun an anode and a directly heated cathode, with the aid of which a gas discharge plasma could be produced. This plasma was employed to calibrate the Langmuir probe in the presence of the magnetic field and in some other auxiliary experiments. The plasma produced by the electron beam was found to extend far beyond the limits of the beam. The microwave field strength and radiation intensity were investigated as functions of the magnetic field strength, gas pressure, beam current, and electron energy, and the results are presented graphically and discussed. The intensity of the uhf radiation varied greatly with the conditions of operation, but such radiation was observed at magnetic field strengths an order of magnitude lower than that corresponding to the electron cyclotron resonance, and in some cases in the absence of a magnetic field. Further work will be required to elucidate the nature of the coupling between the longitudinal plasma oscillations and the transverse electromagnetic waves which makes the radiation possible. Материалы о турбомашинных явлении (вibrationes in Turbomachinery).
Collection of Articles. Moscow, Izd-vo Akademiya Nauk SSSR, 1959, 117 p. Errata slip
Inserted. 20,000 copies printed.

Rasp. M. S. V. Sorenson, Academician, Academy of Sciences, USSR; Ed.; 2d. ed.
Publishing House Tsi. A. Kiberneticheskii Tech. Ed.; V. V. Volovets.

PURPOSE: This collection of articles is intended for scientific research workers, engineers, and designers in the field of turbomachinery.

CONTENTS: This collection of articles deals with vibrations in turbomachinery.

The following topics are discussed: vibrations and stresses in the rotor and bearing of a turbocompressor; vibrations and stability of beams; flaxural vibrations of a rotating shaft; whirling speeds of a flexible rotor with two unbalanced masses; acceleration through resonance of a nonlinear system; whirlind speed and clearance in bearing; dynamic stresses in blades of an axial compressor; and damping of vibrations. No personalities are mentioned. Materials follow several of the articles:

Dorofeev, M.L., V.M. Olshanskiy, A.S. Zilberman, L.I. Lyutikh, M.I. Prigovskiy,
and F.Ye. Schutinov. Investigation of Vibrations and Stresses in the
Motor and Bearing of a High-power Turbogenerator During Operation

The authors discuss an experimental investigation made on a high-power
turbogenerator in order to analyze the real state of stress of the rotor
and vibrations of the rotor and bearings. The dynamic behavior of the
whole system of main rotor and bearing is treated. The influences of the
bases and foundations are not taken into consideration.

Bolotin, V.V. Vibration and Stability of Beams Under Action of Nonconservative Forces

A cantilever rectilinear beam loaded by uniformly distributed following forces acting in the plane of its maximum rigidity is analyzed for stability at planar deformation. Critical parameters of its loading with and without consideration of damping are established.

Churakov, A.I. Acceleration Through Critical Speeds of a Flexible Rotor

with Two Unbalanced Masses in the Presence of Frictions

The author derives a system of two coupled differential equations as a solution to the problem. The solution is based on the following assumptions: that the mass of the shaft, the gyroscopic moments of masses caused by deflections of the shaft, and the initial deflections of the shaft are negligible; that the shaft supports are absolutely rigid; that the shaft itself is torsionally rigid; and that the acceleration through critical speeds is uniform.

Subbotin, V.P. Acceleration Through Resonance. In One Case of a Nonlinear System

An analysis is made of a nonlinear vibration system with one degree of freedom having nonlinear restoring force and excited by a low-frequency sinusoidal disturbing force. The effect of the rate of acceleration on amplitudes of the motion is discussed.

Satayann, L.M. (Deceased). Critical Speeds of a Rotor and Clearances in Bearings

The effect of the clearance in rolling contact bearings on the motion and whirling speed of a rotor is discussed. Rotors having no critical speed are described together with an experimental checking installation for selecting eccentricities of disks.

Rusanova, Tsi. Investigation of Dynamic Stresses in Blades of an Axial Compressor With Wide Control Range

The basic results of an experimental investigation of dynamic stresses in blades of an axial compressor by means of wire resistance transducers placed in the root sections are presented. The behavior of the blade at various speeds, including resonance, is described.

Sergeev, S.I. Damping of Vibrations of Anisotropic Plastic Rotors

Conditions for successful damping of a rotor with unequal elasticity coefficients along its principal axis are discussed. The inertia and

Preparation of methane labeled with carbon¹⁴. B. A. Andreev, B. V. Klimenok, and M. M. Sakharov. *Doklady Akad. Nauk S.S.R.* 94, 1080 (1953). Methane treated with H_2SO_4 gave $^{14}CO_2$, which was circulated with H_2 over the activated catalyst by means of an electromagnetic circulating device, the reaction being run at about 310° (initially 240°). The poisoning of the catalyst by Hg was prevented by Au-wire tampons inserted in the connecting tubes. The product was collected in a cold trap. The catalyst was prep'd by grinding together 2-4 g. Ru with 10 g. asbestos and activated by boiling in 6N HNO_3 10-15 min., then thoroughly washing and drying 30 min. at 400° . The yield of CH_4 was 85.7% both gravimetrically and radiometrically. G. S.

SAKHAROV, M.M.

✓ Exchange of carbon between hydrocarbons in the presence
of aluminosilicate catalyst. B. V. Klimenok, I. A. Al-
drcev, O. V. Krylov, and M. M. Sakharov. *Doklady Akad.*
Nauk S.S.R. 95, 101 (1953). A method is described
for testing the C¹⁴ exchange between hydrocarbons in the
presence of aluminosilicates. C¹⁴H₆, 16 cc., with radioactiv-
ity of 80 μ c., and 560 cc. of C₂H₆ were allowed to react over
100 cc. of aluminosilicate catalyst (I) in a glass lab. cracking
app. at 500° for 1 hr. The product was sep'd. into C₂H₆
and C₃H₈. After purification the C₂H₆ had a radioactivity
of 0.62 μ c. (specific radioactivity 0.010 μ c./mol.), 0.78% of
the original. Similarly with C₂H₆, 490 cc., mixed with
C¹⁴H₆, 232 cc., with radioactivity 206 μ c., allowed to react
at 500° with I for 47.5 min., and purified had a radioac-
tivity of 0.35 μ c. (0.17% of the original). Radioactive
exchange between hydrocarbons occurs only to a slight
extent. A method for measuring the radioactivity is de-
scribed. David S. Gifford

PM J.W.

SAKHAROV, M. M.

U S S R .

Secondary reaction in the catalytic cracking of hydrocarbons by radiochemical methods. Ye. A. Andreev, T. I. Andryanova, B. V. Klimenok, O. V. Krylov, S. Z. Roginskiy, and M. M. Sakharov, Doklady Akad. Nauk S.S.R. 96, 781-4(1954). ---Cracking of C_2H_6 , tagged with C^{14} , in combination with $n-C_6H_{14}$ on an aluminosilicate catalyst at 520° showed 12.4% decompn. for $n-C_6H_{14}$ and 9% for C_2H_6 . Radioactive C_3H_8 , C_4H_{10} , and C_5H_{12} were formed. C_2H_6 plays only a minor part in the formation of coke. Cracking of tagged C_2H_4 and $n-C_6H_{14}$ showed 17.9% destruction for $n-C_6H_{14}$ and 33% for C_2H_4 . Radioactivity of the products was ascribed to copolymerization of C_2H_4 with unsatd. products of cracking. Cracking of tagged C_3H_6 and iso- C_8H_{18} at 500° decompd. 53.4% of iso- C_8H_{18} and 82% of C_3H_6 . C_3H_8 was the radioactive product obtained with the highest yield which indicates intensive hydrogenation of C_3H_6 during cracking. Coking appears to proceed through chemisorption and polymerization of olefins on the surface of the catalyst.

SAKHOV, M.M.

V. V. J. INVESTIGATION OF SECONDARY REACTIONS IN CRACKING OF
HYDROCARBONS, TING C., Andreev, E.A., Andrianova, T.I., Krylov,
S.V. and Sakharov, M.M. (Dokl. Akad. Nauk S.S.R. (Rep. Acad. Sci.
U.S.S.R.), 27 June 1955, vol. 102, (6), 1119-122). Iso-octane
was cracked at 500°C over an alumina-silica catalyst. In successive
experiments radioactive methane, propane and isobutylene were added
to the feed and the radioactivity of the reaction products was
measured. The results showed that methane plays only a slight part
in secondary reactions, while propane and isobutylene react in many
ways, which include the destructive alkylation of iso-octane and the
hydrogenation of isobutylene. (L.)

Title : Synthesis of methylcyclohexane, marked with C¹⁴ in the methyl group

Periodical : Dok. AN SSSR 103/1, 87-89, Jul 1, 1955

Abstract : The three basic phases of the synthesis of methylcyclohexane, marked with C¹⁴ isotope in the methyl group, are described. All synthesis phases take place over non-radioactive substances with the determination of all physical constants of the hexane. The processes of esterification of the benzoic acid marked with C¹⁴ are explained. The extent to which the catalytic isomerization reaction is capable of converting the radio carbon (C¹⁴) from the methyl group into the benzene ring is discussed. Eight references: 5 USSR and 3 Ger. (1895-1954). Table; drawing.
